protein, modules.

Disclosure; Page 4; 18pp; German.

WPI; 2003-031166/03.

New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. ), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily

               The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain Streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proceins (FP), also for detecting FP, Ce.g. on protein chips or microtitre plates. The modules in (I) bind Strongly to streptavidin, with a co-operative effect that provides strongly to streptavidin, with a co-operative effect that provides Stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        តិតិតិតិន្ន័α
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptavidin binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                             (BIOA-)

                                                                                                          CC The invention relates to an isolated peptide (I) comprising at least two CC individual modules separated by 0-50 amino acids, with each containing at CR east one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain CC streptavidin binding modules, are useful as affinity handles for CR purification of recombinant fusion proteins (FP), also for detecting FP, CR e.g. on protein chips or microtitre plates. The modules in (I) bind CR strongly to streptavidin, with a co-operative effect that provides Stronger binding than a single tag, but are displaced by a competitor. CR end of the fere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily CR controllable binding properties. (I) is particularly used for purifying CR prom dilute solution in batch formats (which use simpler apparatus cr is that of a streptavidin binding peptide disclosed with the invention of the column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś

                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a non-competitive immunoassay for a small canalyte, comprising reacting a sample containing the analyte with a reagent pair comprising a first binding partner that binds to the analyte and a second binding partner that binds to the complex of the analyte and the first binding partner, and determining the binding of the second binding partner, and determining the binding of the second binding partner, thus indicating the presence of the analyte in the sample. The first and second binding partners are antibody fragments Fab or scFv. The reagent pair is useful in a non-competitive immunoassay for a small analyte, particularly for assaying drugs of abuse e.g., morphine, THC or amphetamine. The immunoassay is useful for detecting environmental hazards, toxic compounds in food and feed, chemicals indicative of congoing processes (e.g., microbial processes in buildings, metabolic processes of living organisms) and in clinical tests, drug monitoring and pharmacological research. This sequence represents the murine antibody MI Fab fragment heavy chain, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                    cc analyte, comprising reacting a sample containing the analyte with a cc reagent pair comprising a first binding partner that binds to the analyte and the first binding partner that binds to the analyte and the first binding partner, and determining the binding of the second thinding partner, and determining the binding of the second cc binding partner, thus indicating the presence of the analyte and the complet. The first and second binding partners are antibody fragments Fab cr sefv. The reagent pair is useful in a non-competitive immunoassay for a small analyte, particularly for assaying drugs of abuse e.g., morphine, cc manufacture of the analyte and the compounds in food and feed, chemicals indicative of compoing processes (e.g., microbial processes in buildings, metabolic compounds in food and in clinical tests, drug monitoring and comparancological research. This sequence represents the murine antibody M2 Fab fragment heavy chain, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                        밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Prox where X = Gln, Asn or Met. (I), which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion protein set (FP), also for detecting FP, e.g. on protein chips or microtitre plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                        Synthetic.

C given target, comprising subjecting the protein to mutagenesis at the positions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in mutagenesis at the protein. Also described: (1) a mutagenesis at the positions of the protein comprising the protein of hNGAL, AZm or 24p3 having detectable binding affinity to a given target, obtained by the method described above; (2), a fusion protein comprising the mutein of hNGAL, AZm or 24p3, where an enzyme, a protein or a protein domain, a peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, AZm or 24p3 or the fusion protein of hNGAL, AZm or 24p3 or the fusion protein of hNGAL, AZm or 24p3 or the fusion protein of hNGAL, AZm or 24p3 or the fusion protein is useful in generating or producing a mutein of hNGAL, AZm or 24p3 or the fusion protein is useful in generating or producing a mutein of hNGAL, AZm or 24p3 or the fusion protein is useful in generating or producing a mutein of the mutein with a sample suspected of containing the given target under conditions that allow complex formation between the mutein and the given target, and determining the complexed mutein by a suitable signal. The createst is a protein or protein domain, a peptide, a nucleic acid contacting the mutein may also be used in medicine, e.g. for tumour imaging cor directly for cancer therapy. The present sequence represents a condition of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocali. (NNGAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a

                                                                                    Query Match
                                                                                                                                                  The present invention relates to a method for generating muteins of huma neutrophil gelatinase-associated lipocalin (hNGAL), rat alpha2-microglobulin-related protein (A2m) or mouse 24p3/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pill of a filamentous bacteriophage of the M13-family of or a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid phNGAL7, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and an invention.
                                                                                                                Sequence 258 AA;
                                                                                                                                        albumin binding domain of Protein G.
                                                                                                                                                                                                                                                                                                                                           Generating a mutein of a protein for validating the protein as drug target by subjecting the protein to mutagenesis at sequence positions corresponding to sequence positions of the human neutrophil gelatinase-associated lipocalin.
                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2003-381639/36.

CC given target, comprising subjecting the protein to mutagenesis at CC positions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in CC muteins of the protein. Also described: (1) a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of CC hNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a CC peptide, a signal sequence and/or an affinity tag is operably fused to CC the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the CC comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein of c2); and (4) a pharmaceutical composition comprising the mutein of hNGAL, A2m or 2493 or the fusion protein described above, and a carrier. The muteins have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein described by contacting the mutein with a sample suspected of containing the given target by contacting conditions that allow complex formation between the mutein and the given target, and determining the complexed mutein by a suitable signal. The given target is a protein or protein domain, a peptide, a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or mouse 24p3/uterocalin, comprises subjecting the protein to mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mutein; human neutrophil gelatinase-associated lipocalin; hNGAL; rat alpha2-microglobulin-related protein; A2m; mouse 24p3/uterocalin; 24p3; mutagenesis; fusion protein; cytostatic; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocalin (hMgAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; Page 98-99; 122pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  molecule, an organic molecule or a metal complex and the detection is carried out for validation of the protein as a pharmacological drug target. The mutein may also be used in medicine, e.g. for tumour imaging or directly for cancer therapy. The present sequence represents a modified hNGAL, Strep-tag II and albumin binding domain fusion protein given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 258 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the coat protein pIII of a filamentous bacteriophage of the M13-family of for a fragment of the coat protein. The present sequence is the protein encoded by a fragment of plasmid pHNGAL5, used to illustrate the invention. This sequence comprises human hNGAL, a Strep-Tag II and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 400 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fragment of phage coat protein pIII.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neutrophil gelatinase-associated lipocalin (hNGAL), rat alpha2-microglobulin-related protein (A2m) or mouse 2493/uterocalin, by subjecting the protein to mutagenesis. In the method of generating a mutein, a nucleic acid coding for the muteins of the protein resulting from mutagenesis is operably fused at the 3' end with a gene coding for the cost protein pIII of a filamentous bacteriophage of the M13-family or for a fragment of the cost protein. The present sequence is the protein encoded by a fragment of plasmid pHNCAL3, used to illustrate the invention. This sequence comprises human hNCAL, a Strep-Tag II and a fragment of phage coat protein pIII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 400 AA;
Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or m

CC given target, comprising subjecting the protein to mutagenesis at C given target, comprising subjecting the protein to mutagenesis at C gostitions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in CC muteins of the protein. Also described: (1) a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of CC hNGAL, A2m or 2493, where an enzyme, a protein or a protein domain, a CC peptide, a signal sequence and/or an affinity tag is operably fused to the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule CC comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the fusion protein described above, and a carrier. The muteins have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or the fusion protein is useful in detecting a given target by contacting the mutein protein domain, a given target by contacting the mutein between the mutein and the given target and determining the complexed mutein by a suitable signal. The cc given target is a protein or protein domain, a peptide, a nucleic acid molecule, an organic molecule or a metal complex and the detection is carried out for validation of the protein as a pharmacological drug target. The mutein may also be used in medicine, e.g. for tumour imaging cor difficed hNGAL, Strep-tag II and phage coat protein piII fragment fusion protein given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocalin (hXgAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 3; Page 94-95; 122pp; English.

```
CC given target, comprising subjecting the protein to mutagenesis at compositions 33-54, 66-83, 94-106 and/or 123-136 of hNGAL, resulting in CC muteins of the protein. Also described: (1)-a mutein of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by CC hNGAL, A2m or 2493, where an enzyme, a protein comprising the mutein of cc peptide, a signal sequence and/or an affinity tag is operably fused to CC comprising a sequence and/or an affinity tag is operably fused to CC comprising a sequence encoding the mutein of hNGAL, A2m or 2493 or the mutein of hNGAL, A2m or 2493 or the fusion protein described above, and a carrier. The muteins have cytostatic cal composition comprising CC and a carrier. The method is useful in generating or producing a mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein. The mutein of hNGAL, A2m or 2493 or a fusion protein a given target under conditions that allow complex formation between the mutein and the given conditions that allow complex formation between the mutein and the given condition is considered out for validation of the protein as a pertide, a nucleic acid condition of the protein as a pharmacological drug cor directly for cancer therapy. The present sequence represents a condition of the protein plus for tumour imaging cor directly for cancer therapy. The present sequence represents a condition of the exemplification of the protein plus invention.
                                                                                                                                                                                         Matches

CC given target, comprising subjecting the protein to mutagenesis at CC given target, comprising subjecting the protein to mutagenesis at CC muteline of the protein. Also described: (1) a muteline of hNGAL, A2m or CC 2493 having detectable binding affinity to a given target, obtained by the method described above; (2) a fusion protein comprising the mutein of NGAL, A2m or CC peptide, a signal sequence and/or an affinity tag is operably fused to CC the amino or carboxy terminus of the mutein; (3) a nucleic acid molecule comprising a sequence encoding the mutein of hNGAL, A2m or 24p3 or the fusion protein described above, CC the mutein of hNGAL, A2m or 24p3 or the fusion protein described above, CC and a carrier. The muteins have cytostatic activity, and can be used in CC gene therapy. The method is useful in generating or producing a mutein of hNGAL, A2m or 24p3 or the fusion protein mutein of the suspection of the mutein of hNGAL, A2m or 24p3 or the fusion protein target by contacting the mutein of the mutein of hNGAL, A2m or 24p3 or the fusion protein. The mutein of the suspected of containing the given target under CC conditions that allow complex formation between the mutein and the given carget, and determining the complexed mutein by a suitable signal. The given target is a protein or protein domain, a peptide, a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for generating a mutein of a protein selected from a human neutrophil gelatinase-associated lipocalir (hNGAL), rat alpha2-microglobulin-related protein (A2m) and a mouse 24p3/uterocalin (24p3), where the mutein has a detectable affinity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Generating a mutein of a protein, e.g. human neutrophil gelatinase-associated lipocalin, rat alpha2-microglobulin-related protein or m 24p3/uterocalin, comprises subjecting the protein to mutagenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 96-98; 122pp; English.

Sequence 400 AA;

molecule, an organic molecule or a metal complex and the detection is carried out for validation of the protein as a pharmacological drug target. The mutein may also be defined in medicine, e.g. for tuneour imaging or directly for cancer therapy. The present sequence represents a modified hNGAL, Strep-tag II and phage coat protein pIII fragment fusion protein given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein this improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc
                                                                                                      New isolated, modified ADAMTS4 (aggrecanase) stability useful for identifying inhibitors treating aggrecanase-associated conditions,
                                                                                                                                                                                                                                                                                                                                                            29-JUL-2003; 2003WO-US023484.
